30 PYTHON BEGINNER EXERCISES

EXERCISE 1

Write a Python statement that prints "Hello, World!".

EXERCISE 2

Write a Python program to print your name and age on one line, like:

"My name is John and I am 20 years old".

EXERCISE 3

Fix the indentation so this code runs without error and prints "5 is greater than 2":

```
if 5 > 2:
print("5 is greater than 2")
```

EXERCISE 4

Write a comment on one line, then print "Python is fun" on the next line.

EXERCISE 5

Add an inline comment at the end of this line explaining what it does:

print("Learning Python") # Your comment here

EXERCISE 6

Create a variable x with value 5 and a variable y with value "Hello",

then print both on separate lines.

EXERCISE 7

Create three variables a, b, and c on one line with values 1, 2, and 3,

then print them.

EXERCISE 8

Change the value of a variable color from "red" to "blue" and print the new value.

EXERCISE 9

Create variables of different data types: an int, a float, and a str,

then print their types using type().

EXERCISE 10

Given x = "5", cast it to an integer and add 10 to it, then print the result 15.

EXERCISE 11

Given a = 7.9, cast it to an integer and print the result.

EXERCISE 12

Given num = 10, cast it to a string and concatenate it with " apples" to print:

"10 apples".

EXERCISE 13

Create a variable text = "Python" and print its length using len().

EXERCISE 14

Given s = "Hello, World!", print only "Hello".

EXERCISE 15

Given s = "Python", use indexing to print the first character and the last character on separate lines.

EXERCISE 16

Given first = "Hello" and last = "World", print "Hello World" with a space between using string concatenation.

EXERCISE 17

Given name = "john", print it as "JOHN" using a string method.

EXERCISE 18

Given sentence = "I love python", replace "python" with "coding" and print the

new sentence.

EXERCISE 19

Store the number 42 in a variable and print whether it is equal to 42 using a

boolean expression.

EXERCISE 20

Create two variables x = 10 and y = 20 and print the result of x > y.

EXERCISE 21

Write an if statement that prints "x is positive" if x = 3 is greater than 0.

EXERCISE 22

Write code that prints True if 5 is less than 10 and False otherwise

(using a comparison inside print()).

EXERCISE 23

Using two boolean variables is_raining = True and have_umbrella = False,

print the result of is_raining and have_umbrella.

EXERCISE 24

Write a program that reads a number from the user with input(), casts it to int,

adds 5, and prints the result.

EXERCISE 25

Given a = 15 and b = 4, print:

- the integer division result (a // b)

- the remainder (a % b)

each on its own line.

EXERCISE 26

Create a variable pi with value 3.14159 and print a string "Pi is 3.14159" using an f-string.

EXERCISE 27

Given x = 5, update x using x += 3 and print the new value.

EXERCISE 28

Create a variable text = " Python " and print it without leading or trailing spaces using a string method.

EXERCISE 29

Given message = "PYTHON", print it in lowercase, then print it in title case

(first letter uppercase).

EXERCISE 30

Write a program that defines two variables a = True and b = False, and prints

the results of a and b, a or b, and not a on separate lines.

END OF EXERCISES, MERRY CHRISTMASS AND HAPPY EASTER
